

```

HttpServlet
{
  init(config){
    init()
  }
}

```

```

✓ init(config){
    super.init(config)
}

```

```

init(){
}

```

When we override init (servletConfig config) , then to maintain the flow of lifecycle, it is necessary to call super.init(config), this parent method will internally call init() method.

init method gets called only once, when the servlet receives first request

destroy method gets called only once, when we undeploy the application from the server

loan amt, interest rate, number of years,

EMI= total amt/(number of years*12)

Interest --- 3456 rs $(p*r*n)/100$

Total amount-- (loan amt+interest)
